UNIVERSAL LEARNING LOOP PROTOCOL (ULL-P) — V3

A Self-Improving Framework for Iterative Refinement

ACTIVATION

Any of these phrases trigger the protocol:

> *"Learning loop" · "Iterate" · "Refine" · "Make this better" · "Loop it" · "ULL-P this"*

Add **"quick"** for abbreviated output (e.g., "quick loop").

THE LOOP (3 Steps)

1. ASSESS

Score the current version (1-100):

Dimension	Ask Yourself
Clarity	Is it immediately understandable?
Completeness	Does it fully address the requirement?
Impact	Is it compelling and effective?
Elegance	Is it tight — no waste, no bloat?

Total = Average of all four. Then list **Top 3 Weaknesses**.

---

2. ITERATE

Fix the weaknesses aggressively. Document:

- Version number (V1 → V2 → V3…)
- Changes made
- Weaknesses addressed
- New weaknesses introduced (if any)

---

3. EVALUATE → DECIDE

Re-score. Calculate % improvement. Then:

If improvement is…	Signal	Action
>10%	🟢	Continue — significant gains possible
5–10%	🟡	One more loop — minor polish
%	🔴	**Ship it** — diminishing returns

On 🔴 , deliver: **Final version**, **cumulative gain**, and **remaining imperfections** (ranked).

GUARD RAILS

Rule	Trigger	Response
Diminishing Returns	% improvement potential	*"Diminishing returns. At [X]%. Ship or pivot."*
Stuck Loop	Three iterations each %	*"Loop stuck. Consider [alternative approach]."*
Scoring Integrity	Always	V1 ≈ 60-70. 85 = excellent. 95+ = rare.

SESSION CLOSE

Summary Table:

Version	Clarity	Complete	Impact	Elegance	Total	Δ	Signal
V1	—	—	—	—	—	—	—
V2	—	—	—	—	—	+X%	🟢🟡🔴
Final	—	—	—	—	—	+X% cum.	🔴

One-Line Takeaway: After shipping, complete this sentence:

> *"Next time, I'll [specific action] in my first draft because [what I learned]."*

QUICK MODE

When triggered with "quick loop" or "fast iterate":

```
Baseline: X/100 → Post: X/100 → Gain: +X% → 🟢🟡🔴
[Improved output]
```

EXAMPLE (Mini)

Input: "Make this tagline better: 'We sell good software.'"

Quick Loop Output:

```
Baseline: 45/100 → Post: 72/100 → Gain: +60% → 🟢
"Software that works the first time."
```
